Working around
Java Security changes

The new Java 8 update 25 blocks all Java based websites that have not met certain security standards.

There is however a way to run the applets despite this new update’s enhanced security.
• Click the Windows Start button
• Type "Configure Java" into the Search field and press Enter
Locate the Security tab on the Java console
• Locate the Exception Site List
• Select Edit Site List
• Then add your website to the list and hit OK

Acknowledged Java Warning and Continue
Verify your site is added to the list

- Close browser and re-launch website
- Acknowledge Java run notification to load applet
Success!!

Web page loads with functioning Java applet
